Git stash makes Git take all uncommitted changes and stores them in a hidden stash, then restores the directory to a clean state like no changes were made.
git log –all –oneline shows every commit reachable from any branch, even the hidden stashes.
Git stash pop undoes git stash, restoring all stashed changes and removing the changes from the stash. This is good for interruption management, like needing to switch branches to fix a bug, pull updates to a working directory that already contains code, or temporarily hide changes.
